PRODUCT DESIGN / IOS ONBOARDING

Velo onboarding

Developer handoff

Approved screen flow, visual system, interactions, and assets for the Velo onboarding experience.

01 WELCOME
02 INTENT
03 GOAL
04 ANALYSIS
05 QUIZ
06 ANYWHERE
07 PERSONALIZE
08 IDENTITY
09 LEVEL

APPROVED VISUAL BASELINE · 15 OCTOBER 2026

Flow and product scope

Nine approved screens, following the account-entry flow in the separate Velo authentication handoff.

01 Welcome

Understand how you move

02 Use Velo

Runner / Coach / Medical professional

03 Your goal

Fitness / form / injury-risk reduction

04 Lab-quality analysis

Introduce analysis value

05 Game time

INR laboratory-cost quiz

06 Anytime, anywhere

Treadmill, track, or road

07 Personalized analysis

Set context before assessment

08 Runner identity

Optional identity selection

09 Running level

Four levels, min/km

V1 PRODUCT PROMISE

Running-form video analysis plus tailored corrective and strength exercises. Repeat assessments improve Velo's understanding of a runner's movement and training history. Live in-ear coaching is planned for a later phase; do not show it as a V1 feature.

Entry, role, and goal

Preserve the designed order and wording. The Welcome screen is the only single-action screen.

01 Welcome / start

Understand how you move.

Velo turns your running video into a clear picture of your form, then helps you build strength with exercises made for you.

One “Let’s start” button. No Back button. Use full-bleed runner photo and dark scrim.

02 How will you use Velo?

Choose the option that fits you best.

Runner — For my own training / Coach — For the athletes I coach / Medical professional — For clinical movement support

Single selection. Continue activates after selection. Back returns to Welcome. Skip remains available.

03 What brings you to Velo?

Choose the result you care about most.

Improve fitness and performance / Learn about my running form / Reduce my injury risk

Single selection. Explain that the first assessment and exercise plan adapt to this goal. Back and Skip remain available.

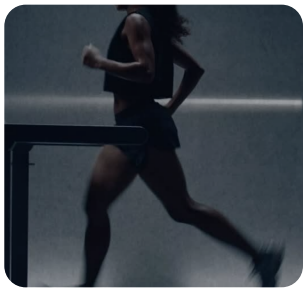

Analysis, quiz, and context

Photos below are the local assets included in this handoff. Keep their crops and dark legibility treatments from the HTML reference.

04 Lab-quality analysis

Velo brings lab-quality analysis to you.
Ever wondered what a full analysis of your running form can reveal?

Use the treadmill photo, progress indicator, dark blue-green scrim, and lime Next action.

05 Game time · laboratory cost

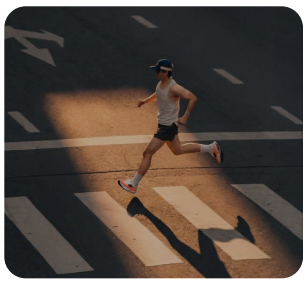

How much do you think a running analysis in a laboratory costs?
Choices: INR 2,500 · INR 5,000 · INR 15,000. The preview treats INR 15,000 as the correct example for a comprehensive advanced biomechanical profile. Prices vary by provider and depth of assessment.

Behavior: a wrong answer turns red, then reveals the correct answer in place; a correct answer gets a restrained confetti burst. Continue after feedback. Keep feedback on the same screen.

06 Anytime, anywhere

Anytime, anywhere.
Whether on a treadmill, track, or road, check your form with Velo.

Use the supplied road-running image, cinematic scrim, progress, and Back / Next footer.

Price examples in the editable spec are educational comparison points, not a standard or guaranteed service price.

Personalization and runner profile

Keep profile questions direct and optional where specified; use the approved icon framing and spacing.

07 Personalized analysis

Velo personalizes your analysis by scanning your running form.
Prompt: “Tell us more about you.” Use deep green gradient and centered copy. Continue with “Let’s go.”

08 Runner identity

How would you identify yourself?
Man · Woman · Non-binary · Prefer not to say. Four equal-height rows; 36 × 36 pt icon frames. Center icons optically. The non-binary vector uses a stroke weight consistent with the other icons.

09 Running level

How would you rate your level in running?
Beginner · Intermediate · Advanced · Elite. Four uniform rows and 36 × 36 pt proficiency-meter icon frames. Use min/km values from `SCREEN_SPEC.md`; they are converted from the Ochy reference and need product validation before being treated as training prescriptions.

Back and Continue remain visible so runners can revisit earlier steps. Use system radio-group semantics and expose the current selection to assistive technology.

Visual system and measurements

Use the HTML preview as the exact visual reference. Build native iOS controls with safe-area-aware constraints and Dynamic Type.

CANVAS	393 × 852 pt reference. Adapt to device bounds; account for the status area, home indicator, and safe areas.
COLOR	Deep blue-green liquid-glass surfaces; Voltage lime #C4F52A for primary actions and selected states.
TYPE	Apple system sans-serif. Screen headline 32–36 pt semibold; question heading 25–27 pt semibold; body 16 pt regular; option labels 15–16 pt semibold; helper text ≥11 pt; action labels 16 pt semibold.
ACTIONS	Welcome: one full-width Let's start action, no Back. All later screens: paired Back and Next/Continue, same capsule height (52 pt standard, 48 pt compact preview), Back narrower and visually quieter.
HORIZONTAL ALIGNMENT	Welcome CTA: 20 pt screen inset. Choice-screen footer: 14 pt inset aligned with the glass panel edges. Other footers: 20 pt inset. Keep all footer pairs centered.
TOUCH AND ACCESS	At least 44 × 44 pt touch targets. Visible keyboard focus, high contrast, Dynamic Type, and reduced-motion support in native implementation.
COPY AND ICON ALIGNMENT	Left-align longer screen copy; center helper lines when specified. Center icons in equal 36 × 36 pt frames. Keep row heights and icon cells uniform.
MOTION	Subtle choice/feedback transitions. Respect Reduce Motion; quiz feedback must remain understandable without animation.

Interaction checklist

Keep behavior predictable and preserve the user’s control across the onboarding flow.

Navigation Back returns to the immediately preceding screen. Continue/Next advances only when required selection or quiz feedback is complete. Avoid trapping the runner in a required optional question.

Skip Show Skip on role, goal, and quiz steps. Skipping advances without creating a value or implying a choice.

Choice groups Role, goal, identity, and level use one-choice selection. Selected state is immediately visible and announced. Identity includes “Prefer not to say.”

Quiz Mark wrong selection in red, reveal the correct price on the same screen, and provide concise context. Correct selection gets a restrained celebration. Do not imply the price is universal.

Progress Keep the progress indicator visible and announce its value to assistive technology.

Native adaptation Rebuild with the project’s existing SwiftUI/UIKit conventions. Use system fonts, safe areas, button/radio semantics, and content-size categories. HTML is a reference prototype, not production code.

Integration Connect onboarding values to the app’s profile model. Confirm event names and persistence policy with the existing implementation. Authentication is specified in the separate Velo auth handoff.

HANDOFF FILES

Preview HTML · frozen approved snapshot · screen specification · four local photo assets · this PDF.
